

Phabulous Physics Unit Plan

Unit Overview
Unit Title
Phabulous Physics
Unit Summary
<p>In this unit, students fully investigate linear motion. After reviewing essential mathematics concepts, students are introduced to laws of motion, velocity and acceleration, vectors, and Newton's Laws using a series of teacher-prepared slideshows. After students have a thorough understanding of these basic concepts, they prepare brochures illustrating a real-world problem related to motion that answers the Unit Question, <i>How do the laws of motion describe everyday events?</i> Students illustrate the problem, show how to solve the problem using physics principles, and use spreadsheets to enter data and graphically show some aspect of the solution. With a firm understanding of these principles, student groups create a survey designed to gather information from the community about a given road hazard. The community data is used to prepare a slideshow presentation that will be presented to the city planners. The goal of the presentation is to persuade the leaders to make changes to a dangerous section of road or intersection.</p>
Subject Area
Physics
Grade Level
11–12
Higher-Order Thinking Skills
Synthesis, Analysis, Problem Solving
Approximate Time Needed
4 weeks, 90-minute classes, daily
Unit Foundation
Targeted Content Standards and Benchmarks
<p>National Science Standards Motions—Grades 9–12</p> <ul style="list-style-type: none">• Objects change their motion only when a net force is applied. Laws of motion are used to calculate precisely the effects of forces on the motion of objects. The magnitude of the change in motion can be calculated using the relationship $F = ma$, which is independent of the nature of the force. Whenever one object exerts force on another, a force equal in magnitude and opposite in direction is exerted on the first object. <p>Gravitation is a universal force that each mass exerts on any other mass. The strength of the gravitational attractive force between two masses is proportional to the masses and inversely proportional to the square of the distance between them.</p>

Student Objectives/Learning Outcomes	
<p>Students will be able to:</p> <ul style="list-style-type: none"> • Use general relationships among position, velocity, and acceleration for the motion of a particle along a straight line to predict where an object will stop • Predict the motion of a projectile in a uniform gravitational field • Determine cause-and-effect relationships among physics concepts 	
Curriculum-Framing Questions	
Essential Question	Can all the events around us be anticipated and explained?
Unit Questions	<ul style="list-style-type: none"> • Can the motion of any object be predicted? • How can understanding the laws of nature make our lives better or safer? • How do the laws of motion describe everyday events?
Content Questions	<ul style="list-style-type: none"> • How are speed and velocity related? • What are Newton's Laws of motion?
Student Assessment Plan	
Assessment Summary	
<p>Assess prior knowledge through a homework assignment, questioning during background multimedia presentations, and a quiz on content knowledge. Based on the results of these assessments, provide additional instruction as necessary.</p> <p>Informally assess students using questioning, feedback, journal reviews, and anecdotal notes while they conduct research and use <i>Visual Ranking</i> and <i>Seeing Reason</i>. Schedule teacher conferences with teams periodically to assess student understanding and redirect teaching as needed. Provide the brochure scoring guide, presentation guide, and project scoring guide to help students monitor their work on the brochure and multimedia presentations. Use the same scoring guides to assess the brochure and final presentation. Provide the oral presentation rubric for peers to give feedback on presentation skills and provide time for students to incorporate the feedback into their final presentation. Have students use the self-assessment on group contribution form to self-assess their work during the project and to help them plan for future project work.</p>

Unit Details

Prerequisite Skills

- Solid unit conversion and mathematical skills
- Familiarity with the equation editor (for brochures and final presentations)

Instructional Procedures

Preparing for the Unit

This unit presumes students have solid mathematical skills. Students should refresh their skills through the introductory homework assignment. An answer key is provided for class review. The homework serves the dual purpose of reviewing conversion skills, and providing the students and teacher with feedback about the students' readiness for the physics unit to come. Provide additional practice if necessary.

Introducing Linear Motion

Introduce the physics of linear motion with the support of the following introductory slideshows: Velocity and Acceleration, Vectors, and Newton's Laws. These slideshows cover the Unit Questions, *How do the laws of motion describe everyday events?* and *Can the motion of any object be predicted?* The presentations also address the Content Questions, *How are speed and velocity related?* and *What are Newton's Laws of motion?*

During each slideshow, ask questions to gauge student understanding. If necessary, provide students with additional examples from the textbook or Internet resources to reinforce these basic concepts.

At this point, give a short quiz assessing conversion skills, vector analysis, and forces. A quiz answer key is provided. The quiz serves the dual purpose of reviewing physics principles, and providing the students and the teacher with feedback about the students' readiness for the completion of the next assignment—developing a brochure. Provide additional practice if necessary.

Creating a Publication

Model the upcoming independent physics project through a whole-class practice activity. Lead the class as they work out a linear motion problem related to traveling locomotives. Guide students as they develop a paper-and-pencil solution and verify their solution. Have students copy the traveling locomotives data into a spreadsheet and create a graph to represent their data (for example, see spreadsheet with graph). If students have not used spreadsheet software to enter data and create graphs, provide them with whole-class guidance using a projector and/or provide them with the spreadsheet help page.

After students complete these activities, show the class the locomotive problem brochure to give them a sample of the final product.

Group students into pairs. Instruct each pair to create a brochure that illustrates a real-world problem that is related to motion and answers the Unit Question, *How do the laws of motion describe everyday events?* as well as the broader Essential Question, *Can all the events around us be anticipated and explained?*

To ensure students understand the assignment and how they will be assessed, distribute the brochure scoring guide and discuss the project criteria in detail. In partners, ask students to assess the locomotive problem brochure using the rubric. Then as a class, discuss students' ratings and try to come to consensus about the ratings given for the various traits.

Have students select a problem from the example projectile problems or another drawn from their physics textbook. Ask them to work out the paper-and-pencil solution, and then illustrate and verify the problem and solution—making corrections to mathematics as needed. Finally, have students develop a brochure that includes the following elements:

- Statement and explanation of the problem
- Illustration of the problem (clipart or scanned original work)
- Key kinematic equations and a mathematical solution to the problem
- Graph showing a mathematical representation of the problem
- Comments and insights about the problem

Have students prepare a five minute presentation about the problem and its solution, supported by the display of their brochure. Make sure to clarify or cover any additional material that is crucial and not answered by the individual presentations.

Ask students to provide feedback to their peers about the presentations using the oral presentation rubric. Allow time for partners to review the feedback and incorporate suggestions into their next presentation.

Beginning the Project

Have students keep individual journals describing information obtained during the course of the project. Review journals throughout the project to check for understanding, provide feedback, and adjust instruction as necessary.

Tell students that they will take on the role of members of a transportation safety advocacy group. Their task is to create and deliver presentations to the city planners proposing changes to dangerous sections of road or intersections, and answer the Unit Question, *How can understanding the laws of nature make our lives better or safer?* and the broader Essential Question, *Can all the events around us be anticipated and explained?*

Ranking the Hazards

To help students compare, prioritize, and analyze different hazardous locations, introduce them to the *Visual Ranking Tool*. Before you use *Visual Ranking* with your students, examine the [Visual Ranking Web site](#) and become familiar with the tool.

Set up a project and add teams in the teacher workspace. Assign the students to groups and lead the class through a discussion of safe driving. Ask the class, *Since you have begun driving, how many of you have personally been in or know someone who has been in an accident?* After some discussion, have the students offer the names of sections of roads or intersections that they feel are unsafe. After brainstorming five to seven dangerous roadways, enter these into the teacher workspace of *Visual Ranking*. Have the groups log in to their [Visual Ranking student workspace](#) and rank the locations from most hazardous to least hazardous. Student groups should provide reasons for their choices in the comment boxes. Circulate through the room while the groups work, taking anecdotal notes,

questioning for understanding, and providing feedback as necessary. After all groups have finished ranking the list, have each group compare their ranking with other groups' rankings. Lead a class discussion of why the rankings might be different. Students should then individually record information in their journals. If possible, invite the head of transportation public safety to participate in the ranking and include these results in the discussion.

Creating a Survey

Either assign or have student groups pick a dangerous section of road or intersection from the list generated previously in class. Student groups will create a survey designed to gather information from the community about their given road hazard to obtain public information. Have students create their survey using a survey maker, such as [SurveyMonkey](#)*, or a blog such as [Blogger](#)*, to post their questions and collect information. A sample [survey](#) and a sample [blog](#) were created as examples for this unit. Review the sites with students as models for expectations and to answer any questions. Send letters home and solicit parent responses. If possible, see if your local newspaper will include a brief description of your class project and include the survey or blog site link for the class. Tell the class that feedback obtained through the site will be included in the final presentation. As feedback is obtained, have students include the data in their journals.

Conducting Research

Allow students time to conduct research on their chosen hazardous roadway. Have the class look through local newspapers and resources as well as conduct Internet research. Have students write their information in their individual journals.

Schedule conferences while students are conducting research to answer questions, monitor their progress, and provide additional help as necessary.

Creating a Causal Map

To help students investigate cause-and-effect relationships, introduce them to the *Seeing Reason Tool*. Before you use *Seeing Reason* with your students, examine the [Seeing Reason Web site](#) and become familiar with the tool.

Set up a project in the teacher workspace and make sure the teams are assigned. Have students look at a [sample traffic causal map](#) in *Seeing Reason* that looks at the many factors that affect road safety. Remind students that their map will look very different because it will focus on the physics involved in a hazardous roadway or intersection. Have teams log in to their [Seeing Reason student workspace](#). Ask student teams to create a causal map of the factors that make their road or intersection hazardous. As responses are obtained from the student's Web site, have them modify their causal maps and add this data to their student journals. Encourage more research, and incorporate any additional information into the team causal map. Use the comments portion of the tool to provide feedback to the group as they work on this portion of the project.

Creating Presentations

Have students create and deliver a 10- to 15-minute slideshow presentation outlining a given section of road or intersection. Have students use kinematic equations to explain the problem and their proposed solution to the road hazard. The presentations answer the Unit Questions, *How do the laws of motion describe everyday events?* and *Can the motion of any object be predicted?* as well as the bigger Essential Question, *Can all the events around us be anticipated and explained?* To ensure students understand the assignment and how they will be assessed, distribute the project scoring guide and presentation guide. Discuss the project criteria in detail with the class. Remind students that they will take on the role of members of a transportation safety advocacy group. Their task is to make presentations to the city planners proposing changes to dangerous sections of road or intersections. Make sure to clarify any project questions and remind students to incorporate the peer feedback from their previous presentation as they plan and practice for their final presentation.

Completing Final Presentations

On the day of presentations, tell students that they will take turns making presentations and asking questions about each team's road hazard and the research behind it. When the audience is asking

questions, they take on the roll of city planners trying to determine the best use of limited transportation funds to change a dangerous section of road or intersection. When answering the questions, the presenters take on the role of members of a transportation safety advocacy group. Invite administrators and teachers with planning periods during this class to participate.

After all presentations are complete, debrief the activity and summarize the suggestions. To wrap up, pose the Unit Question, *How can understanding the laws of nature make our lives better or safer?* and the broader Essential Question, *Can all the events around us be anticipated and explained?* Facilitate a class discussion that targets the study of roadways and intersections and then draws some final conclusions about the study of linear motion in the real world.

As a final reflection, ask students to complete the self-assessment on group contribution form to help them plan for future project work.

Accommodations for Differentiated Instruction

Special Needs Student	<ul style="list-style-type: none">• Distribute project storyboards and guidelines to help guide the student's work and monitor the student's progress regularly• Provide the student with additional templates or scaffolds to ensure project success• Place the student in cooperative groups that will help the student achieve• Allow additional time for when necessary
Nonnative Speaker	<ul style="list-style-type: none">• Provide the student with a list of basic vocabulary words and definitions ahead of time• Provide additional visual and graphic displays to teach content area material• Allow the student to choose to demonstrate understanding of the academic concepts with models, drawings, diagrams, and so forth• Provide the student with additional templates or scaffolds to ensure project success
Gifted/Talented Student	<ul style="list-style-type: none">• Challenge the student to apply acquired learning to the development of working models and to the explanation of everyday phenomena of motion• Provide the student with the option to substitute or participate in enhanced components of each project throughout the unit
