This assignment is simply coming up with a group. Groups should be composed of at least four people. If the enrollment in the class does not make it possible to have all teams of four, then as many teams of five as necessary can be formed.

Teams should be formed based on a well diversified education background. At least one member of the team should be well versed in computer architecture. An example of good team composition could be a group member interested in device physics, another in high speed digital design, another in low power digital design, and another in computer architecture.
