

## Intel® Omni-Path Fabric Software (IFS) Package Licensing Information

This document provides licensing information for the following IFS packages:

- IntelOPA-IFS.[OS Distribution]-x86\_64.[Release version].tgz
- IntelOPA-BASIC.[OS Distribution]-x86\_64.[Release version].tgz

The IFS packaging consists of many individual RPM and SRPM components. Each component is provided with its own license file. The following is an example list (not a complete listing) of the various licenses:

- Intel Proprietary closed source licensing
- BSD 3-clause
- Dual BSD/GPLV2
- GNU General Public License v2.0 (Kernel modules only, does not link to any other component)

In addition, a "Third party Copyright Notices and Licenses" document is included which provides copies of all third party licensing that may have been used in the development of the software and firmware contained in the IFS package. These are not outbound licenses for any item in this package and are provided for reference only.

For preliminary releases which may be provided to select Intel development partners, a "Pre-Release Notice" file is also included. This notice identifies the software as intended for test and evaluation purposes only and not for public disclosure or use in a production environment. If the software file has been released publically by Intel, the terms of the Pre-Release Notice are deleted.
